They are protected by the Copyright Law (PD No. 49) and not for quotation or reprinting without prior approval.

ABSTRACT

The paper lays out some of the issues around recent world economic events particularly rising protectionism in developed countries. These issues include export potential of manufactured products of developing countries, the interaction and consequences of developed country policies that restrict trade on developing countries, multilateral trade negotiations, and international trade patterns.

To discuss the issues the paper traces factors that have led to rising protectionism, point out manifestations of protectionism, explains the implications for developing countries, and indicate directions for these countries.

The paper concludes that the behavior of rising protectionism is detrimental to both developed and developing countries, puts a strain on commitments to free trade and distorts the natural and market process of comparative advantage positions of both types of countries.

RISING PROTECTIONISM IN DEVELOPED COUNTRIES AND ITS IMPLICATIONS FOR DEVELOPING COUNTRIES

ROUGH NOTES

Florian A. Alburo*

In recent years there has been a growing perception that growth in world trade has decelerated. The perception manifests itself in the negotiations for trading agreements wherein countries either hold into existing restrictive arrangements or substitute new but equally restrictive guidelines for the dismantling of others at the same time announcing a commitment to free trade. Partly resulting from serious economic crises that have troubled most of the world, the more specific perception is the increasing protectionist move among developed and industrialized countries and the reactions taken by others that have been, if any, retaliatory.

This paper is intended to lay out some of the issues around recent world economic events and to understand the notion of rising protectionism in developed countries and its implications for the developing countries. In the four sections of this paper

^{*}Associate Professor, School of Economics, University of the Philippines. This paper was prepared for a UP Law Center seminar on UNCTAD V, "designed to arouse national consciousness on the issues to be discussed in the coming conference on May 1979."

an attempt is made to (a) trace some factors that have led to rising protectionism, (b) elaborate on some of the manifestations of protectionism, (c) point out a range of implications for the developing countries, and (d) indicate directions and options for the trading nations.

a recent was not them are heed a crown income. At

The post-war growth of world trade has been significantly high relative to the previous post-depression era. This was characterized by satisfactory economic performance among most world trading nations and problems were more of searching for acceptable means of liquidity, of transferring real resources and of helping emerging nations into sustained growth paths, than of opposing barriers to trade.

emission care a company of the second se

But the succeeding disturbances, internally or internationally, during the late sixties and early seventies have led to an emerging order with a character wherein countries, especially developed ones, began to pay more attention to domestic interests and applied inward-looking policies. Some of the mutually reinforcing dimensions precipitating this changing order were the prominent inflation and employment issues, the oil crises and raw materials question, the slow recovery from various shocks, and the increasing competition

posed by developing countries in the international trading arena.

The wide application of post-Keynesian synthesis in economic policies in the United States and Western industrialized countries to prime growth at targetted rates carried with it inflationary and unemployment tendencies the long term trade-offs of which not many appreciated nor anticipated. With the increasing difficulties of saving unemployment and inflation dilemma, more and more clamor was heard for policies to direct domestic economic activities.

A creeping inflation, interpersed with undesirable employment effects, became more prominent with the instance of the oil crises in 1973. The shock was doubly dramatic since not only was a four-fold price increase in oil unanticipated but that the possibility of supply cartels was indeed real. This singular disturbance also revealed the dependency structure, at least for some countries such as Japan, in the international trading system. The resulting domestic focus came in the form of adjustment measures to ease affected industries and an accelerated search for energy substitutes.

The twin factors of domestic economic management and coping with the oil crises implied a slow and difficult recovery. If comparison can be made on the performance of industrialized

countries before and during the onset of the set of dimension that demanded inward and protectionist stance, it is clearly shown that only about half of the growth rate was recovered in the ensuing years. For example, the average annual growth of the gross domestic product in North America was about 4 percent in the decade of 1960-70 while only 2.4 percent in 1970-75. Japan achieved 9.4 percent prior to the crises and struggled to 5.0 percent in 1970-75.

In the more germane scene of international trade, the changing and emerging comparative advantage structure signalled the competitiveness of developing countries' exports of light manufactures in such products as clothing, leather, and electronics. Partly because of constant technology in these types of industries and partly due to slow labor productivity growth unit costs in the light and semi-manufactures industries implied declines in comparative advantage relative to some developing countries. The reactions to this changing pace of comparative advantage have been both emotional and rational. Within the affected industries and firms, the demand has been for support of distressed sectors. Within some developed countries, the alternative have been to devise ways and schemes for a compromise -- preserving or easing adjustment processes while at the same time finding ways to accommodate industrial growth and competitiveness of developing countries. All in all however the

Both traditional trade and non-trade barriers were increasingly erected especially after the 1974 general recession. Although simultaneous negotiations were being carried out to promote freer trade, it is apparent from the forgoing discussion

The same of the same of the same

that indeed the eventual effects were far from the avowed intentions of free trade and commerce.

Salar Strain Strain Strain Strain Perhaps the single victim of increased protectionism would be trade of semi and light manufactures from the developing countries. As pointed out previously, this seems to be where the growing comparative advantage of low labor cost countries' lie. While it is true that trade in primary products still dominate developing country commerce, rates of growth of manufacturing exports have been greater significance. 2 Conversely, it is also in the area of manufacturing that developed countries potential lies. Obviously this is where both conflict and agreement will happen. Exports that go through multi-stage processing or accrue high value Control of the Contro added such as those in the field of manufactures undoubtedly contribute to developing countries' aim of industrial growth and Condition on bidelite. sustained economic development. It is thus important to achieve accelerated trade in these items of comparative advantage. In the same vein therefore policies which hinder the free exchange and trade among them constraint any country's growth potential.

Neither can one expect diffused and sustained long run development from primary export trade. Low income elasticities of demand, availability of adequate substitute, and the specter

of fixed supplies would contribute to trade instability among them.

Aprezio a mente in a con esta interesa de la como en estata comerciona e como material de facilitada

intended to provide focus in the assessment of various protectionist policies adopted by developed countries.

First, the imposition of tariffs provide the initial vehicle in putting trade barriers. The tariff structure of developed countries has been biased against semi-finished and efinished manufactures. Although progress has been made in the the five rounds of the General Agreement on Tariffs and Trade (GATT), in the Kennedy Round between 1967 and 1972 and in the meurrent Tokyo Round in terms of reducing the absolute ad valorem duties of traded products across different stages of processing, the relatives. 4 Structure remains the same. The average nominal tariff levels in 1973 in the European Economic Community (EEC). the United States (U.S.), Japan, Australia, Sweden, and New Zealand among others have been 2 percent on all items of raw materials, 8 percent on semi-finished manufactures, and 9.3 percent on 15 1 W + 15 Common · finished manufactures. 5 The multiple escalation of nominal tariffs is particularly deterring increases in value added in For example, the trade weighted the developing countries. . - . . . average tariffs of eleven developed countries is zero for raw hides and skins, 9.6 percent for Bovine cattle and equine leather, 5.6 percent for sheep and lamb skin leather, 14.3 percent for travel goods, 13.1 percent for leather clothing and accessories, and 16.4 imposes 6.1 percent nominal tariffs for raw cotton, 8.3 percent for cotton yarn and 15.6 percent for cotton fabrics. 7

when now the tariff structure is reckoned in terms of their effective rates, the protective wall would obviously be higher. The mean tariff rates from some calculations show effective rates to be twice to as much as three times the nominal rates such as the U.S. (8.6 percent and 18 percent respectively), Japan (16.5 percent and 45.4 percent), and EEC (12.2 percent and 33.1 percent). As long as tariff cuts are couched in nominal terms the room for protection is still large and in fact preserved. Comparing Pre-Kennedy and Post-Kennedy Round ariff rates on industrial countries' imports of manufactures from the developing countries, the average nominal rate decreased from 17.1 percent to 11.8 percent yet in effective terms it dropped from 33.4 percent to 22.6 percent.

Second, with the acceptance of the need to reduce protectionist stance along tariff cuts, multi-lateral trade negotiations (MTN), the adoption of most-favored-nation (MFN) clauses, and just the sheer commitment to free trade must come short-term measures

intended to cushion the impact of developing country accessibility to developed country markets. Various forms of non-tariff barriers (NTB) are being imposed either to artificially encourage exports or curtail imports.

What is particularly noticeable in this context is that more countries have applied a wider range of NTB's to a greater proportion of their imports in 1976 than at any time since the 1974 recession or the prior crises year. The manifestations of such NTB's are many and varied -- from institutional schemes such as customs classifications and procedures, weights and measures, trade and marketing agreements, health requirements to technical schemes as safety requirements, various taxes, quotas, and countervailing duties -- a cmount can be made up to 47 different schemes.

And the first property of

The message of NTB's is that they can more than adequately provide the protection that nominal tariffs do in interantional trade, either multilaterally or through bilateral arrangements. Standards of safety are equivalent to MFN tariff structures since they are applicable to all countries. The few research studies of NTB's show a positive association between (unweighted) tariff averages and NTB-incidence rates such that if success is made in regard to MTN tariff reductions, the NTB's are likely to absorb the protective mechanism.

· 对"一点"

Maria San

which the bilateral negotiations level, NTB's are equal notion. tools of protectionism. The creation of Orderly Marketing Agreements (OMA) in the U.S. is effectively a quota system designed to protect domestic industries from developing country competition. The same can be said of "voluntary export restraints" arrangements A. 3 760 11.45 2 ... between importing and exporting nations. It must be admitted 1.00 Sec. 25. 50 however that in some cases, such applications are warranted (e.g. balance of payments problems) although one can argue that NTB's may not be the appropriate solution. The issue is not the appli-200 cation but rather the extent to which they curtail the efficient $\mathfrak{S}^{\mathfrak{t}}$: structural change in the international trading system.

Third, and along the same line as NTB's the concern for environmental factors in developed countries has critical implications for pricing a competitiveness of developing country exports. For one, the stringent standards set by importing countries demand additional processes which could have been achieved. For S 10 3 another, the detailed environmental matters developed countries seek in particular products are not usually symmetric in developing 4 ty (A) countries. Through transmission, such protectionist measures shift 1.14 pricing structures even in the domestic sectors of the developing in the first of the first of the second of t 34.4 countries.

Mark the first that the second of the second

2.0

Finally, there is also apparent distortion in the manner itself of physically moving manufactured exports from developing to developed countries. It appears that shipping rates, perhaps administered, escalate with the processing stages of the products being exported. Furthermore, the shipping freight rates donot appear either to be determined by the associated (derived) demand for the products being stripped.

ere soone in the e

The enumeration of the various tariffs and non-tariff barriers as mechanisms that reflect protectionist atmosphere in developed countries imply that the exhaustion of traditional barriers to trade does not quarantee a freer world trading system. What must be appreciated is that the institution of protectionist measures to limit or prohibit trade has consequences for both trading countries in the short and in the long run. It is only by understanding these can discussions of trading arrangements be seen in a proper perspective. The implications of the growing protectionist sentiments among developed countries need to be clarified in the context of the exporting and importing nations.

in **tri**

Given the variety of protectionist tools the developed countries have evolved, one need not invoke nor technically explain

neoclassical international economics in order to point out their associated theoretical and empirical difficulties.

On the part of the developing countries, rising protectionism among developed countries does not bode well for sustained and accelerated economic growth. Restrictions imposed and barriers erected prevent smooth structural adjustments according to factor endowments and comparative costs to occur not only in one country but among developing countries. For example, as Japan adjusts to and increasing comparative advantage in heavy industries she must be able to break into new markets as she moves from labor-intensive light manufactures. Similarly, emerging developing countries must be able to get access to developed country markets for light manufactures in order to gain comparative advantage at the same time displacing Japan. But none of these adjustments will occur if trade rigidities are present. Therefore, while restrictions may be product or country specific, their implications are far more general and A STATE OF BEEN encompassing.

Lower export earnings may mean inability to secure development assistance through loans, unfulfilled growth plans and downward adjustments for balance of payments purposes. Skewed nominal and effective protection rates tend to prevent manufacturing processes that would otherwise be optimally pursued in a regime of freer trade. Since trading prices include in them distorted resource costs, resource misallocations are the general tendencies in both developing and developed economies.

On the part of developed countries, the rationale includes preventing mass unemployment in import-competing industries, avoiding inflationary pushes that disturb the general economy, and easing adjustment processes in cases of clear comparative advantage.

The issues of unemployment as a result of developing country imports is never clear to be of net benefit to developed countries. The evidence that sorrounds this is pretty ambiguous yet indicative. ning i saar kende nga melala dan merenjakan sagalih menang ini salah menangan berajak For example, it is probably true that employment is more affected by her ann thick is displayed in Abello with the April the economy in general than imports in particular. Where imports TO BE THE STATE OF are concerned it is known that employment lost through imports are fully offset by employment in the export industries. Of course THE MEDIT OF THE POST OF GRAPH TO SHAPE THE PROPERTY OF THE PARTY OF T adjustments may have to be made in particular firms or affected The second of the second second industries. But then the need may be for incentives for resource المراجعين فيواريون mobility rather than adjustment reliefs.

The stark implication of these behaviors is that developed and developing countries are affected by the volume and direction of

And Control of

trade with each other. Yet it is the developed countries which are affected more by this kind of protectionist stance. Around 21 percent of the merchandise exports to developed countries went to developing countries while around 72 percent of developing country exports went to the developed countries. In absolute size however, what's important is the volume and value. The World Bank reports one US\$ 123 billion exports from developed countries (1975) whereas developing countries exported in turn around US\$ 26 billion. The interaction between the two kinds of countries through trade has been quantified to show that a 3.1 percent increase in the growth rate of non-OPEC developing countries lead to a 1 percent in the growth of OECD.

1.

the same of the second state of

with respect to the perceived surge of developing country products into industrialized nations, developing country exports of manufactured products are on the average an insignificant (but growing fast) fractions of total supply -- less than 10 percent. The implication argued of displacing import competing industries is not true though some painful adjustment may be necessary to arrive at an equilibrium mix of numbers in the industry structure.

Astronomic Services

In the short run, it is quite obvious that protectionist policies provide latent relief to affected industries, reduce

imports, and improve payments situation (assuming this is a concern). On the other hand, supplying countries experience plant under-capacities, reduce export earnings, and worsened payments position. To the extent however that restrictive practices are not followed the short run also creates uncertainties for developing countries and opens industry sentiments in developed countries to be translated into protectionist policies.

What the use of the kinds of protectionist tools outlined in this section means is that the long run trade patterns may be inefficient and not reflective of comparative costs and resource endowments. To continue applying protectionism in the short run delays smooth structural readjustments vis-a-vis cost and demand changes and only create rigidities that ultimately will have to faced. In this context, in terms of foregone production and growth, the developing countries would be at the shorter end. But the fact remains that developed countries are also bound to equally suffer.

Considering the apparent net disadvantages of the growing protectionism for both developed and developing countries, one wonders whether such policies are pursued for non-economic reasons. Needless to say, the MTN provides a partly sober forum

to assess various alternatives and directions for the developing countries.

TV

Assuming developing country potentials are in manufactured exports, various options are worthwhile to consider in trade negotiations. Given the past few years' track record, it would seem the long-run opportunities are mostly in manufactures for many emerging and developing countries, including the Philippines.

Philippine trade patterns follow the character of a developing country — a spurt of manufactured export growth in recent years, devolution of traditional exports into processed forms and increasing portion of new nontraditional products traded. With a recent yearly growth of 30 percent, manufactured exports are expected to take the brunt of trade in the coming decade reaching a 50 percent share (from its present 34 percent). Such new exports as textile yarn, fabrics and made-up articles, clothing, paper and paper products, handbags and others hold promise. The conditions and environment under which will thrive however appear sensitive in view of the strong protectionist sentiments earlier explained. The negotiations that will have

to be followed is therefore critical for shaping an international order and comparative advantage for most developing countries.

Not only is a gradual dismantling of existing tariffs desirable but what must be vigorously pursued is a shift in any remaining tariff structure away from increases in rates as processing increases, and at the extreme towards uniform duties across the board.

A first agenda is therefore to work for tariff reductions. Despite the results of some studies 13 showing that a uniform liberalization might initially create second generation problem (e.g. ten countries reaping majority of additional gains from tariff cuts), in view of necessary adjustment processes. 4 this is a trade off that must be accepted (though its costs perhaps minimized) as part of a long-term vision.

A second task is to negotiate removal or reduction in the present and proposed set of quotas and other forms of non-tariff barriers. With regard to NTB's, it is not so much their arbitrariness but their subject to wide discretion in the hands of the administrative authorities. The recent reports about opposing classification of Philippine exports to the U.S. attest to this grey area of discretion either in order to avoid falling

under agreed-upon quotas or of classifying goods under them.

, in the figure of the complete of the contract of the complete of the complet

What seems to be most attractive within these two tasks is to work in the direction of discussing both tariff and non-tariff questions simultaneously. The suggestion of some developed countrice. (e.g. Canada) to look at MTN sectorally but as a package appears a fruitful avenue assuming developing countries accept a commitment to free trade. To negotiate trading arrangements by looking at mechanisms in isolation from one another invites schemes to promote protectionism in developed countries. Indeed once agreement is reached for MFN or tariff reductions, it is likely that by some domestic demand NTB's can be imposed since the disposal of one retains non-tariff substitutes for possible imposition. For as long as this option of simultaneous approach is feasible, this is less likely to create new trade barriers.

A final task (and issue as well) that appears to be partly dragging the protectionist behavior is the demand of developed countries for reciprocity. True enough, the developing countries demand for the principle of non-reciprocity might have warranted some strong validaty in the search for trading arrangements prior to the 1974 recession since it was quite clear developed countries' performances were impressive. But the recent trends, the buoyant

and their growing competitive ability indicate less hope of adhering to non-reciprocity. The option is perhaps to slowly and eclectically accept reciprocity. In terms of a long-run comparative advantage structure, this obviously can be turned to developing country advantage. For one, the varied nominal and effective protection engendered by developing countries may be useful for some "infant industries" but really need closer examination and market test that can be objectively gauged only in an interantional market setting. For another, reciprocity carries with it the notion of allowing developed countries some information about their own set of new comparative advantages. Finally, reciprocity tempered with appreciation of some other mitigating conditions (e.g. balance of payments) can put pressure for rationalizing a broad based development process.

In short, the rising protectionism, in developed countries, an internal and external reaction, poses a potent threat to freer and larger trade between developed and developing nations. And since the protectionist stance is a reaction, there are still wide possibilities for averting the consequences of a new form of "neo-nationalism".

Indeed the alternative might be to foster intra-developing country trade and intra-developed country trade. Though both types of trade have expanded equally, well, it must be accepted that such an alternative has a closer and more bounded limit in terms of technical change, consumer preferences, and production structure. One must come to this only when lines have been already drawn. And that does not appear in sight as yet.

In the period 1960-1975, a dramatic shift in the composition of developing countries exports accrued showing manufactures increase by three times in share from 5 to 17 percent of merchandise exports.

The developed countries on the other hand experienced during the same period a growth in share of manufactured exports of only around 40 percent from 52 to 76 percent of its merchandise exports.
